CSS STYLE SHEET

- When a browser reads a style sheet, it will change the HTML document in accordance with styles specified in the style sheet.
- CSS Style sheet describes the presentation of an HTML document in the browser window.

Internal Style Sheet:

- An internal style sheet is used for a single web page which apply different style.
- Internal styles are defined within the <style> element, inside the <head> section of an HTML page.

Sample Code:

```
<! DOCTYPE html>

<html>

   <head>

       <style>

       h1

           {

             color: blue;

           }
```

```
            </style>

        </head>

        <body>

            <h1>Welcome To Wikitechy</h1>

            <p>Just a normal paragraph</p>

        </body>

</html>
```

Code Explanation:

```
<!DOCTYPE html>
<html>
    <head>
        <style>
            h1          1

            {
                    color:blue;          2
            }
        </style>
    </head>
    <body>
    3   ─→  <h1>Welcome To Wikitechy</h1>

            <p>Just a normal paragraph</p
            >
    </body>
</html>
```

1 Here we have Opened the style tag(<style></style>) inside head section of the html page. H1 element is used to CSS to **2** specify the heading of a web page.

Color property is used to specify font color for the html element contents. Here we are applying blue color for the h1 text.

3 Over here, the text **"Welcome To Wikitechy"** is the heading of our web page which will have styles that applied internally.

Output:

1 **The text "Welcome to wikitechy"** will appear in blue color which we can see in the output.

2 The text **"Just a normal paragraph"** will appear normally for which we have not specified any styles.
